#### Abstract

In this paper we study interaction of two miscible liquids in porous media. The model consists of a system of equations coupling hydrodynamic equations with Korteweg stress terms and reaction-diffusion equation for the concentration. We assume that the fluid is incompressible and its motion is described by the Darcy law. The global existence and uniqueness of solutions is established for some optimal conditions on the reaction source term and external forces functions. Numerical simulations are performed to show the behavior of two miscible liquids subjected to Korteweg stress.

Keywords: Darcy approximation, Korteweg stress, miscible liquids, porous media

## 1 Introduction

There exists transient interfacial phenomena between two miscible liquids similar to interfacial tension [1]. However they are rather weak and they decay in time because of the mixing of the two liquids due to molecular diffusion $[1,2]$. Investigation of such phenomena is motivated by enhanced oil recovery, hydrology, frontal polymerization, groundwater pollution and filtration $[3,7,8,9,10]$.

In 1901 Korteweg introduced additional stress terms in the Navier-Stokes equations in order to describe the influence of the composition gradients on fluid motion [11]. In 1949, Zeldovich studied the existence of a transitional interfacial tension and described it with the following expression [12]:

$$
\sigma=k \frac{[C]^{2}}{\delta},
$$

where $[C]$ is the variation of mass fraction through the transition zone, and $\delta$ is the width
this zone. This relationship was generalized by Rousar and Nauman to the systems far from equilibrium, for linear concentration gradients [13]. In 1958, Cahn and Hilliard introduced the free energy density for a non-homogeneous fluid [14]:

$$
e=e_{0}+k|\nabla \rho|^{2},
$$

where $e_{0}$ is the energy density of a homogeneous fluid and $\rho$ denotes the density of the fluid.
A miscible liquid model with fully incompressible Navier-Stokes equations is studied in [15]. Modelling and experiments of miscible liquids in relation with microgravity experiments were carried out in [3]-[6]. The existence and uniqueness of solutions for miscible liquids model in porous media is studied in [16].

In this paper, we continue of miscible liquids in porous media. We consider a threedimensional formulation and introduce the source terms in the equation of motion and in the equation for the concentration. The paper is organized as follows. The next section is devoted to the model presentation, while Section 3 deals with the existence of solutions. We establish the uniqueness of solutions in Section 4 followed in Section 5 by numerical simulations.

## 2 Model presentation

The model describing the interaction of two miscible liquids is written as follows:

$$
\begin{gather*}
\frac{\partial C}{\partial t}+u \cdot \nabla C=d \Delta C-C g  \tag{2.1}\\
\frac{\partial u}{\partial t}+\frac{\mu}{K} u=-\nabla p+\nabla \cdot T(C)+f  \tag{2.2}\\
\operatorname{div}(u)=0 \tag{2.3}
\end{gather*}
$$

We consider the boundary conditions:

$$
\begin{equation*}
\frac{\partial C}{\partial n}=0, \quad u \cdot n=0, \quad \text { on } \Gamma, \tag{2.4}
\end{equation*}
$$

and the initial conditions:

$$
\begin{equation*}
C(x, 0)=C_{0}(x), u(x, 0)=u_{0}(x), x \in \Omega \tag{2.5}
\end{equation*}
$$

Here $u$ is the velocity, $p$ is the pressure, $C$ is the concentration, $d$ is the coefficient of mass diffusion, $\mu$ is the viscosity, $K$ is the permeability of the medium, $\Gamma$ is a Lipschitz continuous boundary of the open bounded domain $\Omega, n$ is the unit outward normal vector to $\Gamma, f$ is the function describing the external forces such as gravity and buoyancy while the term, $g$ stands for the reaction source term. The stress tensor terms are given by the relations:

$$
T_{11}=k\left(\frac{\partial C}{\partial x_{2}}\right)^{2}, T_{12}=T_{21}=-k \frac{\partial C}{\partial x_{1}} \frac{\partial C}{\partial x_{2}}, T_{13}=T_{31}=-k \frac{\partial C}{\partial x_{1}} \frac{\partial C}{\partial x_{3}}
$$

$$
T_{23}=T_{32}=-k \frac{\partial C}{\partial x_{2}} \frac{\partial C}{\partial x_{3}}, T_{22}=k\left(\frac{\partial C}{\partial x_{1}}\right)^{2}, T_{33}=k\left(\frac{\partial C}{\partial x_{3}}\right)^{2}
$$

where $k$ is nonnegative constant. We set

$$
\nabla \cdot T(C)=\left(\begin{array}{l}
\frac{\partial T_{11}}{\partial x_{1}}+\frac{\partial T_{12}}{\partial x_{2}}+\frac{\partial T_{13}}{\partial x_{3}}  \tag{2.6}\\
\frac{\partial T_{21}}{\partial x_{1}}+\frac{\partial T_{22}}{\partial x_{2}}+\frac{\partial T_{23}}{\partial x_{3}} \\
\frac{\partial T_{31}}{\partial x_{1}}+\frac{\partial T_{32}}{\partial x_{2}}+\frac{\partial T_{33}}{\partial x_{3}}
\end{array}\right)
$$

In order to state the problem in the variational form we need to introduce function spaces:

$$
S_{u}=\{u \in H(\operatorname{div} ; \Omega) ; \operatorname{div}(u)=0, u . n=0 \text { on } \Gamma\}, \quad S_{C}=\left\{C \in H^{2}(\Omega) ; \frac{\partial C}{\partial n}=0 \text { on } \Gamma\right\} .
$$

The variational form of the problem is to find $C, u$ such that for all $B, v$ the following equalities hold:

$$
\begin{gather*}
\left(\frac{\partial C}{\partial t}, B\right)+d(\nabla C, \nabla B)+(u \cdot \nabla C, B)+(g C, B)=0  \tag{2.7}\\
\left(\frac{\partial u}{\partial t}, v\right)+\mu_{p}(u, v)-(\operatorname{div} T(C), v)-(f, v)=0 \tag{2.8}
\end{gather*}
$$

Here $\mu_{p}=\mu / K$. The functions $f(x, t)$ and $g(x)$ are assumed to be a sufficiently regular in $\Omega$ such that the first is bounded in $L^{\infty}\left(0, t ; L^{2}(\Omega)\right)$, the second is bounded in $L^{\infty}(\Omega)$ and both of them are positive.

## 3 Global existence of solutions

We begin the proof of existence of solutions with the following lemmas.
Lemma 3.1 The concentration $C$ is bounded in the $L^{\infty}\left(0, t ; L^{2}\right)$ space.
Proof Choosing $C$ as test function in (2.7) and taking into account that $g$ is a positive function, we get the inequality:

$$
\frac{1}{2} \frac{\partial}{\partial t}(C, C)+d(\nabla C, \nabla C)+(u . \nabla C, C) \leq 0
$$

Since $u \in S_{u}$, the last term vanishes. The second term is positive, so integrating by time we obtain:

$$
\|C(t=s)\|_{L^{2}}^{2} \leq\left\|C_{0}\right\|_{L^{2}}^{2} .
$$

From this inequality, it follows that $C$ is bounded in $L^{\infty}\left(0, t ; L^{2}\right)$.

Lemma 3.2 The concentration $C$ is bounded in $L^{\infty}\left(0, t ; H^{1}\right)$ and the velocity $u$ is bounded in $L^{\infty}\left(0, t ; L^{2}\right)$.

Proof Choosing $-k \Delta C$ as test function in equation (2.7), we have:

$$
\left(\frac{\partial C}{\partial t},-k \Delta C\right)+(u \cdot \nabla C,-k \Delta C)=d(\Delta C,-k \Delta C)+(g C, k \Delta C) .
$$

Next, since the reaction source term $g$ is bounded, we get from the previous estimate:

$$
\frac{k}{2} \frac{\partial}{\partial t}(\nabla C, \nabla C)+d k(\Delta C, \Delta C)-k(u . \nabla C, \Delta C) \leq k g_{0}(\nabla C, \nabla C)
$$

Then

$$
\begin{equation*}
\frac{1}{2} \frac{\partial}{\partial t}(\nabla C, \nabla C)+d(\Delta C, \Delta C) \leq(u . \nabla C, \Delta C)+g_{0}(\nabla C, \nabla C) . \tag{3.1}
\end{equation*}
$$

Also, by choosing in (2.8), $u$ as test function we obtain:

$$
\begin{equation*}
\frac{1}{2} \frac{\partial}{\partial t}(u, u)+\mu_{p}(u, u)-(\nabla \cdot T(C), u)=(f, u) \tag{3.2}
\end{equation*}
$$

In order to have an explicit expression of $\nabla \cdot T(C)$, we calculate its first component:

$$
\begin{equation*}
\frac{\partial T_{11}}{\partial x_{1}}+\frac{\partial T_{12}}{\partial x_{2}}+\frac{\partial T_{13}}{\partial x_{3}}=2 k \frac{\partial C}{\partial x_{2}} \frac{\partial^{2} C}{\partial x_{1} \partial x_{2}}-k \frac{\partial^{2} C}{\partial x_{1} \partial x_{2}} \frac{\partial C}{\partial x_{2}}-k \frac{\partial C}{\partial x_{1}} \frac{\partial^{2} C}{\partial x_{2}^{2}}-k \frac{\partial^{2} C}{\partial x_{1} \partial x_{3}} \frac{\partial C}{\partial x_{2}}-k \frac{\partial C}{\partial x_{1}} \frac{\partial^{2} C}{\partial x_{3}^{2}} . \tag{3.3}
\end{equation*}
$$

Hence

$$
\frac{\partial T_{11}}{\partial x_{1}}+\frac{\partial T_{12}}{\partial x_{2}}+\frac{\partial T_{13}}{\partial x_{3}}=k \frac{\partial C}{\partial x_{1}} \frac{\partial^{2} C}{\partial x_{1} \partial x_{2}}+k \frac{\partial C}{\partial x_{1}} \frac{\partial^{2} C}{\partial x_{1} \partial x_{3}}+k \frac{\partial C}{\partial x_{1}} \frac{\partial^{2} C}{\partial x_{1}^{2}}-k \frac{\partial C}{\partial x_{1}} \Delta C .
$$

Then

$$
\frac{\partial T_{11}}{\partial x_{1}}+\frac{\partial T_{12}}{\partial x_{2}}+\frac{\partial T_{13}}{\partial x_{3}}=\frac{k}{2} \frac{\partial}{\partial x_{1}}(\nabla C)^{2}-k \frac{\partial C}{\partial x_{1}} \Delta C .
$$

Following the same steps for the second component, we conclude:

$$
\nabla \cdot T=\frac{k}{2} \nabla(\nabla C)^{2}-k \Delta C \nabla C .
$$

Replacing this last equality in (3.2) and since $u \in S_{u}$, we have:

$$
\begin{equation*}
\frac{1}{2} \frac{\partial}{\partial t}(u, u)+\mu_{p}(u, u)-k(\Delta C \nabla C, u)=(f, u) . \tag{3.4}
\end{equation*}
$$

Adding (3.4) to the inequality (3.1), and with the fact $u \in S_{u}$ and $C \in S_{c}$, we have:

$$
\begin{gathered}
\quad \frac{1}{2} \frac{\partial}{\partial t}((u, u)+k(\nabla C, \nabla C))+\mu_{p}(u, u)+d k(\Delta C, \Delta C) \leq(f, u)+g_{0}(\nabla C, \nabla C) . \\
\frac{1}{2} \frac{\partial}{\partial t}((u, u)+k(\nabla C, \nabla C))+\mu_{p}(u, u)+d k(\Delta C, \Delta C) \leq \frac{1}{2}(f, f)+\frac{1}{2}(u, u)+g_{0}(\nabla C, \nabla C) .
\end{gathered}
$$

Since the third and the fourth terms in the left hand side inequality are positives, we have:

$$
\frac{\partial}{\partial t}((u, u)+k(\nabla C, \nabla C)) \leq(f, f)+(u, u)+2 g_{0}(\nabla C, \nabla C) .
$$

Therefore

$$
\frac{\partial}{\partial t}((u, u)+(\nabla C, \nabla C)) \leq \frac{(f, f)}{\min (1 ; k)}+\frac{\max \left(1 ; 2 g_{0}\right)}{\min (1 ; k)}((u, u)+(\nabla C, \nabla C)) .
$$

By integrating over time, and since $f$ is bound in $L^{\infty}\left(0, t ; L^{2}\right)$, we have:

$$
\begin{array}{r}
\|u(t=s)\|_{L^{2}}+\|\nabla C(t=s)\|_{L^{2}} \leq\left\|u_{0}\right\|_{L^{2}}+\left\|\nabla C_{0}\right\|_{L^{2}}+\frac{f_{0}}{\min (1 ; k)} \\
+\frac{\max \left(1 ; 2 g_{0}\right)}{\min (1 ; k)} \int_{0}^{t}\left(\|u(s)\|_{L^{2}}+\|\nabla C(s)\|_{L^{2}}\right) d s .
\end{array}
$$

From the Gronwal Lemma, it follows:

$$
\|u(t=s)\|_{L^{2}}+\|\nabla C(t=s)\|_{L^{2}} \leq\left(\left\|u_{0}\right\|_{L^{2}}+\left\|\nabla C_{0}\right\|_{L^{2}}+\frac{f_{0}}{\min (1 ; k)}\right) \times \exp \left(\frac{\max \left(1 ; 2 g_{0}\right) t}{\min (1 ; k)}\right)
$$

We conclude that $C$ is bounded in $L^{\infty}\left(0, t ; H^{1}\right)$ and $u$ is bounded in $L^{\infty}\left(0, t ; L^{2}\right)$ for $t \in[0 ; T]$.

Lemma 3.3 The time derivative of the concentration $\frac{\partial C}{\partial t}$ is bounded in $L^{2}\left(0, t ; L^{2}\right)$.
Proof From the equation (2.7), since $g$ is a positive function and by the triangle inequality, we have:

$$
\left\|\frac{\partial C}{\partial t}\right\|_{L^{2}} \leq d\|\Delta C\|_{L^{2}}+\|u . \nabla C\|_{L^{2}}
$$

Using Hölder inequality, we obtain:

$$
\left\|\frac{\partial C}{\partial t}\right\|_{L^{2}} \leq d\|\Delta C\|_{L^{2}}+\|u\|_{L^{4}}\|\nabla C\|_{L^{4}},
$$

and from the Gagliardo-Nirenberg inequality, it follows that $\exists N>0$ such that:

$$
\left\|\frac{\partial C}{\partial t}\right\|_{L^{2}} \leq d\|\Delta C\|_{L^{2}}+N\|u\|_{L^{2}}^{1 / 2}\|\nabla u\|_{L^{2}}^{1 / 2}\|\nabla C\|_{L^{2}}^{1 / 2}\|\nabla C\|_{H^{1}}^{1 / 2}
$$

We conclude that $\frac{\partial C}{\partial t}$ is bounded in $L^{2}\left(0, t ; L^{2}\right)$.
Lemma 3.4 The time derivative of the velocity $\frac{\partial u}{\partial t}$ is bounded in $L^{2}\left(0, t ; L^{2}\right)$.
Proof To prove this lemma, it is sufficient to remark that $\nabla \cdot T(C)$ is a sum of the expressions of the form $\lambda D_{i}\left(D_{j} C D_{l} C\right)$, where $D_{i}=\frac{\partial}{\partial x_{i}}, \quad i=1,2,3$ and $\lambda$ depending on $i, j$ and $l$ (see for example (3.3)). We have the following:

$$
\begin{aligned}
\left\|D_{i}\left(D_{j} C D_{l} C\right)\right\|_{S_{C}^{\prime}} & \leq\left\|D_{j} C D_{l} C\right\|_{L^{2}(\Omega)} \\
& \leq\left\|D_{j} C\right\|_{L^{4}(\Omega)}\left\|D_{l} C\right\|_{L^{4}(\Omega)} \\
& \leq \mathcal{M}\left\|D_{j} C\right\|_{L^{2}(\Omega)}^{1 / 2}\left\|D_{l} C\right\|_{L^{2}(\Omega)}^{1 / 2}\left\|D_{j} C\right\|_{H^{1}(\Omega)}^{1 / 2}\left\|D_{l} C\right\|_{H^{1}(\Omega)}^{1 / 2}
\end{aligned}
$$

We notice that $f$ is a bounded function. Using the the same reasoning as for the previous lemmas, we prove that $\frac{\partial u}{\partial t}$ is bounded in $L^{2}\left(0, t ; L^{2}\right)$.

We can now formulate the main result of this section.
Theorem 3.5 The problem (2.1)-(2.5) admits a global solution.
Proof It is easy to see that the problem admits a finite-dimensional solutions $C_{m}$ and $u_{m}$ defined on the interval of time $\left[0 ; T_{m}\left[\right.\right.$. From the previous Lemmas applied to $C_{m}$ and $u_{m}$ we deduce the global existence of those solutions.

Furthermore, the previous Lemmas provide the existence of subsequences, still denoted by $C_{m}$ and $u_{m}$, such that

$$
\begin{gathered}
C_{m} \rightarrow C \text { in } L^{2}\left(0, T ; S_{C}\right) \text { weakly, } \\
C_{m} \rightarrow C \text { in } L^{\infty}\left(0, T ; H^{1}\right) \text { weak-star, } \\
C_{m}^{\prime} \rightarrow C^{\prime} \text { in } L^{2}\left(0, T ; S_{C}^{\prime}\right) \text { weakly },
\end{gathered}
$$

and

$$
\begin{gathered}
u_{m} \rightarrow u \text { in } L^{2}\left(0, T ; S_{u}\right) \text { weakly, } \\
u_{m} \rightarrow u \text { in } L^{\infty}\left(0, T ; H_{d i v}\right) \text { weak-star, } \\
u_{m}^{\prime} \rightarrow u^{\prime} \text { in } L^{2}\left(0, T ; S_{u}^{\prime}\right) \text { weakly }
\end{gathered}
$$

By some classical compactness theorems (see for example [17, 18]), we also obtain the strong convergence of ( $C_{m} ; u_{m}$ ) and by passing to the limit we obtain the existence of solutions.

## 4 Uniqueness of solution

In order to prove uniqueness of solution, we will assume that the problem (2.1)-(2.5) has two different solutions ( $C_{1}, u_{1}$ ) and ( $C_{2}, u_{2}$ ). From (2.1), we have:

$$
\begin{equation*}
\frac{\partial}{\partial t}\left(C_{1}-C_{2}\right)-d \Delta\left(C_{1}-C_{2}\right)+u_{1} \nabla C_{1}-u_{2} \nabla C_{2}+g\left(C_{1}-C_{2}\right)=0 \tag{4.1}
\end{equation*}
$$

and from (2.2), we also get:

$$
\begin{align*}
\frac{\partial}{\partial t}\left(u_{1}-u_{2}\right)+\mu_{p}\left(u_{1}-u_{2}\right)+\nabla\left(p_{1}-p_{2}\right) & =\frac{k}{2} \nabla\left(\left(\nabla C_{1}\right)^{2}-\left(\nabla C_{2}\right)^{2}\right) \\
& -k\left(\Delta C_{1} \nabla C_{1}-\Delta C_{2} \nabla C_{2}\right) . \tag{4.2}
\end{align*}
$$

Multiplying (4.1) by $-k \Delta\left(C_{1}-C_{2}\right)$ and integrating, we obtain:

$$
\begin{aligned}
& \left(\frac{\partial}{\partial t}\left(C_{1}-C_{2}\right),-k \Delta\left(C_{1}-C_{2}\right)\right)+d k\left(\Delta\left(C_{1}-C_{2}\right), \Delta\left(C_{1}-C_{2}\right)\right) \\
+ & \left(u_{1} \nabla C_{1},-k \Delta\left(C_{1}-C_{2}\right)\right)+\left(u_{2} \nabla C_{2}, k \Delta\left(C_{1}-C_{2}\right)\right)+\left(g\left(C_{1}-C_{2}\right),-k \Delta\left(C_{1}-C_{2}\right)\right)=0 .
\end{aligned}
$$

Similarly, multiplying (4.2) by $u_{1}-u_{2}$ and integrating, we have:

$$
\begin{aligned}
\left(\frac{\partial}{\partial t}\left(u_{1}-u_{2}\right), u_{1}-u_{2}\right)+\mu_{p}\left(u_{1}-u_{2}, u_{1}-u_{2}\right)= & \frac{k}{2}\left(\nabla\left(\left(\nabla C_{1}\right)^{2}-\left(\nabla C_{2}\right)^{2}\right), u_{1}-u_{2}\right) \\
& -k\left(\Delta C_{1} \nabla C_{1}-\Delta C_{2} \nabla C_{2}, u_{1}-u_{2}\right) .
\end{aligned}
$$

Adding the two last equalities, using Green formula and the fact that $u_{i} \in S_{u}$, we conclude that

$$
\begin{array}{r}
\frac{1}{2} \frac{\partial}{\partial t}\left(\left\|u_{1}-u_{2}\right\|_{L^{2}}^{2}+k\left\|\nabla C_{1}-\nabla C_{2}\right\|_{L^{2}}^{2}\right)+\mu_{p}\left\|u_{1}-u_{2}\right\|_{L^{2}}^{2}+k d\left\|\Delta\left(C_{1}-C_{2}\right)\right\|_{L^{2}}^{2}= \\
k\left(u_{1} \nabla\left(C_{1}-C_{2}\right), \Delta\left(C_{1}-C_{2}\right)\right)+k\left(\left(u_{1}-u_{2}\right) \nabla C_{2}, \Delta\left(C_{1}-C_{2}\right)\right)- \\
k\left(\Delta C_{1} \nabla\left(C_{1}-C_{2}\right), u_{1}-u_{2}\right)+k\left(-\Delta C_{1} \nabla C_{2}+\Delta C_{2} \nabla C_{2}, u_{1}-u_{2}\right)+ \\
k\left(g\left(C_{1}-C_{2}\right), \Delta\left(C_{1}-C_{2}\right)\right) .
\end{array}
$$

Therefore

$$
\begin{array}{r}
\frac{1}{2} \frac{\partial}{\partial t}\left(\left\|u_{1}-u_{2}\right\|_{L^{2}}^{2}+k\left\|\nabla C_{1}-\nabla C_{2}\right\|_{L^{2}}^{2}\right)+\mu_{p}\left\|u_{1}-u_{2}\right\|_{L^{2}}^{2}+k d\left\|\Delta\left(C_{1}-C_{2}\right)\right\|_{L^{2}}^{2}= \\
k\left(u_{1} \nabla\left(C_{1}-C_{2}\right), \Delta\left(C_{1}-C_{2}\right)\right)-k\left(\Delta C_{1} \nabla\left(C_{1}-C_{2}\right), u_{1}-u_{2}\right)+ \\
k\left(g\left(C_{1}-C_{2}\right), \Delta\left(C_{1}-C_{2}\right)\right) . \tag{4.3}
\end{array}
$$

We will now estimate the right-hand side of this equality. We put $C=C_{1}-C_{2}$ and $u=$ $u_{1}-u_{2}$. From the Hölder inequality it follows that:

$$
\left|\left(\Delta C_{1} \nabla C, u\right)\right| \leq\left\|\Delta C_{1}\right\|_{L^{2}}\|\nabla C . u\|_{L^{2}} \leq\left\|\Delta C_{1}\right\|_{L^{2}}\|\nabla C\|_{L^{4}}\|u\|_{\left(L^{4}\right)^{2}} .
$$

Also, from the Gagliardo-Nirenberg inequality we get:

$$
\left|\left(\Delta C_{1} \nabla C, u\right)\right| \leq N_{1}\left\|\Delta C_{1}\right\|_{L^{2}}\|\nabla C\|_{L^{2}}^{1 / 2}\|\Delta C\|_{L^{2}}^{1 / 2}\|u\|_{L^{2}}^{1 / 2}\|\nabla u\|_{L^{2}}^{1 / 2} .
$$

Next, applying the Young inequality, we obtain:

$$
\left|\left(\Delta C_{1} \nabla C, u\right)\right| \leq \frac{N_{1}}{4}\|\Delta C\|_{L^{2}}^{2}+\frac{3 N_{1}}{4}\left\|\Delta C_{1}\right\|_{L^{2}}^{4 / 3}\|\nabla C\|_{L^{2}}^{2 / 3}\|u\|_{L^{2}}^{2 / 3}\|\nabla u\|_{L^{2}}^{2 / 3} .
$$

Using that same technics, we obtain the following inequality:

$$
\left|\left(u_{1} \nabla C, \Delta C\right)\right| \leq\|\Delta C\|_{L^{2}}\left\|\nabla C \cdot u_{1}\right\|_{L^{2}} \leq\|\Delta C\|_{L^{2}}\|\nabla C\|_{L^{4}}\left\|u_{1}\right\|_{\left(L^{4}\right)^{2}} .
$$

Therefore

$$
\left|\left(u_{1} \nabla C, \Delta C\right)\right| \leq N_{2}\|\Delta C\|_{L^{2}}^{3 / 2}\|\nabla C\|_{L^{2}}^{1 / 2}\left\|u_{1}\right\|_{L^{2}}^{1 / 2}\left\|\nabla u_{1}\right\|_{L^{2}}^{1 / 2}
$$

Finally

$$
\left|\left(u_{1} \nabla C, \Delta C\right)\right| \leq \frac{3 N_{2}}{4}\|\Delta C\|_{L^{2}}^{2}+\frac{N_{2}}{4}\|\nabla C\|_{L^{2}}^{2}\left\|u_{1}\right\|_{L^{2}}^{2}\left\|\nabla u_{1}\right\|_{L^{2}}^{2} .
$$

From (4.3) and assuming that $N_{1}+3 N_{2} \leq 4 d$, we have:

$$
\frac{1}{2} \frac{\partial}{\partial t}\left(\|u\|_{L^{2}}^{2}+k\|\nabla C\|_{L^{2}}^{2}\right) \leq \frac{3 N_{1} k}{2}\left\|\Delta C_{1}\right\|_{L^{2}}^{4 / 3}\|\nabla C\|_{L^{2}}^{2 / 3}\|u\|_{L^{2}}^{2 / 3}\|\nabla u\|_{L^{2}}^{2 / 3}
$$

$$
\begin{gathered}
+\frac{N_{2} k}{2}\|\nabla C\|_{L^{2}}^{2}\left\|u_{1}\right\|_{L^{2}}^{2}\left\|\nabla u_{1}\right\|_{L^{2}}^{2}+k g_{0}\|\nabla C\|_{L^{2}}^{2} \leq\left(\|u\|_{L^{2}}^{2}+k\|\nabla C\|_{L^{2}}^{2}\right) \times \\
\left(\frac{N_{2}}{2}\|\nabla C\|_{L^{2}}^{2}\left\|u_{1}\right\|_{L^{2}}^{2}\left\|\nabla u_{1}\right\|_{L^{2}}^{2}+\frac{3 N_{1} k}{2}\left\|\Delta C_{1}\right\|_{L^{2}}^{4 / 3}\|\nabla C\|_{L^{2}}^{2 / 3}\|u\|_{L^{2}}^{-4 / 3}\|\nabla u\|_{L^{2}}^{2 / 3}+k g_{0}\right) .
\end{gathered}
$$

Denote

$$
\phi(t)=\|\nabla C\|_{L^{2}}^{2}\left\|u_{1}\right\|_{L^{2}}^{2}\left\|\nabla u_{1}\right\|_{L^{2}}^{2}+\left\|\Delta C_{1}\right\|_{L^{2}}^{4 / 3}\|\nabla C\|_{L^{2}}^{2 / 3}\|u\|_{L^{2}}^{-4 / 3}\|\nabla u\|_{L^{2}}^{2 / 3}+1
$$

and

$$
M=\max \left(\frac{N_{2}}{2}, \frac{3 N_{1} k}{2}, k g_{0}\right) .
$$

Then we have the following estimate

$$
\frac{d}{d t}\left(\exp \left(M \int_{0}^{t} \phi(s) d s\right)\left(\|u\|_{L^{2}}^{2}+k\|\nabla C\|_{L^{2}}^{2}\right)\right) \leq 0
$$

for all $t \geq 0$. From this we deduce that

$$
\exp \left(M \int_{0}^{t} \phi(s) d s\right)\left(\|u\|_{L^{2}}^{2}+k\|\nabla C\|_{L^{2}}^{2}\right) \leq\|u(0)\|_{L^{2}}^{2}+k\|\nabla C(0)\|_{L^{2}}^{2} .
$$

Since $u(0)=C(0)=0$, we conclude the uniqueness of solution. We can now statee the theorem on the uniqueness of solution.

Theorem 4.1 The problem (2.1)-(2.5) admits a unique solution.

## 5 Numerical simulations

For numerical simulations, we will consider the 2D problem without reaction term and external forces. We will introduce the stream function defined by the equalities

$$
u_{1}=\frac{\partial \psi}{\partial x_{2}}, \quad u_{2}=-\frac{\partial \psi}{\partial x_{1}},
$$

and the vorticity $\omega=\operatorname{rot}(u)$ The problem becomes:

$$
\begin{gather*}
\frac{\partial \omega}{\partial t}+\mu_{p} \omega=\frac{\partial}{\partial x_{1}}\left(\frac{\partial T_{21}}{\partial x_{1}}+\frac{\partial T_{22}}{\partial x_{2}}\right)-\frac{\partial}{\partial x_{2}}\left(\frac{\partial T_{11}}{\partial x_{1}}+\frac{\partial T_{12}}{\partial x_{2}}\right),  \tag{5.1}\\
\frac{\partial C}{\partial t}+\left(\frac{\partial \psi}{\partial x_{2}},-\frac{\partial \psi}{\partial x_{1}}\right) \cdot \nabla C=d \Delta C  \tag{5.2}\\
\omega=-\Delta \psi \tag{5.3}
\end{gather*}
$$

Numerical method. We begin with equation (5.2). It is solved by the alternative direction implicit finite difference method with Thomas algorithm:

$$
\begin{gathered}
\frac{C_{i, j}^{n+\frac{1}{2}}-C_{i, j}^{n}}{h_{t} / 2}=d\left(\frac{C_{i-1, j}^{n+\frac{1}{2}}-2 C_{i, j}^{n+\frac{1}{2}}+C_{i+1, j}^{n+\frac{1}{2}}}{h_{x}^{2}}+\frac{C_{i, j-1}^{n}-2 C_{i, j}^{n}+C_{i, j+1}^{n}}{h_{y}^{2}}\right) \\
-\frac{\psi_{i, j+1}^{n}-\psi_{i, j-1}^{n}}{2 h_{y}} \frac{C_{i+1, j}^{n+\frac{1}{2}}-C_{i-1, j}^{n+\frac{1}{2}}}{2 h_{x}}+\frac{\psi_{i+1, j}^{n}-\psi_{i-1, j}^{n}}{2 h_{x}} \frac{C_{i, j+1}^{n}-C_{i, j-1}^{n}}{2 h_{y}}, \\
\frac{C_{i, j}^{n+1}-C_{i, j}^{n+\frac{1}{2}}}{h_{t} / 2}=d\left(\frac{C_{i-1, j}^{n+\frac{1}{2}}-2 C_{i, j}^{n+\frac{1}{2}}+C_{i+1, j}^{n+\frac{1}{2}}}{h_{x}^{2}}+\frac{C_{i, j-1}^{n+1}-2 C_{i, j}^{n+1}+C_{i, j+1}^{n+1}}{h_{y}^{2}}\right) \\
-\frac{\psi_{i, j+1}^{n}-\psi_{i, j-1}^{n}}{2 h_{y}} \frac{C_{i+1, j}^{n+\frac{1}{2}}-C_{i-1, j}^{n+\frac{1}{2}}}{2 h_{x}}+\frac{\psi_{i+1, j}^{n}-\psi_{i-1, j}^{n}}{2 h_{x}} \frac{C_{i, j+1}^{n+1}-C_{i, j-1}^{n+1}}{2 h_{y}} .
\end{gathered}
$$

In equation (5.1) we replace $T_{i j}$ by their expressions through the concentrations:

$$
\begin{equation*}
\frac{\partial \omega}{\partial t}+\mu_{p} \omega=k\left(\frac{\partial C}{\partial x_{1}}\left(\frac{\partial^{3} C}{\partial x_{2}^{3}}+\frac{\partial^{3} C}{\partial x_{1}^{2} \partial x_{2}}\right)-\frac{\partial C}{\partial x_{2}}\left(\frac{\partial^{3} C}{\partial x_{1}^{3}}+\frac{\partial^{3} C}{\partial x_{1} \partial x_{2}^{2}}\right)\right) \tag{5.4}
\end{equation*}
$$

We use the finite difference scheme

$$
\begin{aligned}
\omega_{i, j}^{n+1}= & \frac{1}{1+h_{t} \mu_{p}} \omega_{i, j}^{n}+k \frac{h_{t}}{1+h_{t} \mu_{p}}\left(\frac { C _ { i + 1 , j } ^ { n + 1 } - C _ { i - 1 , j } ^ { n + 1 } } { 2 h _ { x } } \left(\frac{C_{i, j+2}^{n+1}-2 C_{i, j+1}^{n+1}+2 C_{i, j-1}^{n+1}-C_{i, j-2}^{n+1}}{2 h_{y}^{3}}\right.\right. \\
& \left.+\frac{\left(C_{i+1, j+1}^{n+1}-C_{i+1, j-1}^{n+1}\right)-2\left(C_{i, j+1}^{n+1}-C_{i, j-1}^{n+1}\right)+\left(C_{i-1, j+1}^{n+1}-C_{i-1, j-1}^{n+1}\right)}{2 h_{x}^{2} h_{y}}\right) \\
& -\frac{C_{i, j+1}^{n+1}-C_{i, j-1}^{n+1}}{2 h_{y}}\left(\frac{C_{i+2, j}^{n+1}-2 C_{i+1, j}^{n+1}+2 C_{i-1, j}^{n+1}-C_{i-2, j}^{n+1}}{2 h_{x}^{3}}\right. \\
& \left.\left.+\frac{\left(C_{i+1, j+1}^{n+1}-C_{i-1, j+1}^{n+1}\right)-2\left(C_{i+1, j}^{n+1}-C_{i-1, j}^{n+1}\right)+\left(C_{i+1, j-1}^{n+1}-C_{i-1, j-1}^{n+1}\right)}{2 h_{y}^{2} h_{x}}\right)\right) .
\end{aligned}
$$

Equation (5.3) is solved by the fast Fourier transform method.

Numerical results. An example of numerical simulations is shown in Figures 1 and 2. Figure 1 shows the evolution of the miscible drop in time. The transient interfacial tension affects the geometry of the drop and its shape becomes more spherical. At the same time, the maximum of the concentration decreases due to diffusion (Figure 2, left). The stream lines is shown in Fig. 2 (right). Though transient interfacial phenomena are sufficiently weak, they provoke the motion of fluid which is initially quiescent.

Figure 1: Evolution of the concentration during 100 seconds for $d=3 \times 10^{-3}, k=10^{-7}$ and $\mu_{p}=100$.

Figure 2: The maximum of stream function as function of time for for $d=3 \times 10^{-3}, k=10^{-7}$ and $\mu_{p}=10$ (left). The stream lines for the same parameters and after 100 s (right)
