

## Valuation domains and local domains

Let  $V$  be a domain,  $F$  its field of fractions. We call  $V$  a valuation domain if, for every  $x \in F$  either  $x \in V$  or  $x^{-1} \in V$ . Let  $M$  be a maximal ideal of  $V$  and  $I$  an arbitrary ideal. If  $x \in I$  and  $x \notin M$ , let  $y \in M, y \neq 0$ . Then  $x/y \notin V$ , for otherwise  $x = (x/y)y$  would be in  $M$ , so  $y/x \in V$  and  $y = (y/x)x \in I$ . So we conclude that  $M \subset I$  and since  $M$  is maximal  $M = I$  and  $x$  does not exist. Thus  $I \subset M$  and, in particular,  $M$  is the unique maximal ideal of  $V$ .

A domain with an unique maximal ideal is called a local domain. The ring of power series in two variables over a field is a local domain which is not a valuation domain.  $R = k[[x, y]]$  has a unique maximal ideal  $(x, y)$  ( $R/(x, y)$  is isomorphic to  $k$  by  $f \mapsto f(0, 0)$  so  $(x, y)$  is maximal and every  $f \in R, f(0, 0) \neq 0$  is invertible). But  $R$  is not a valuation domain, since neither  $x/y$  nor  $y/x$  are in  $R$ .
